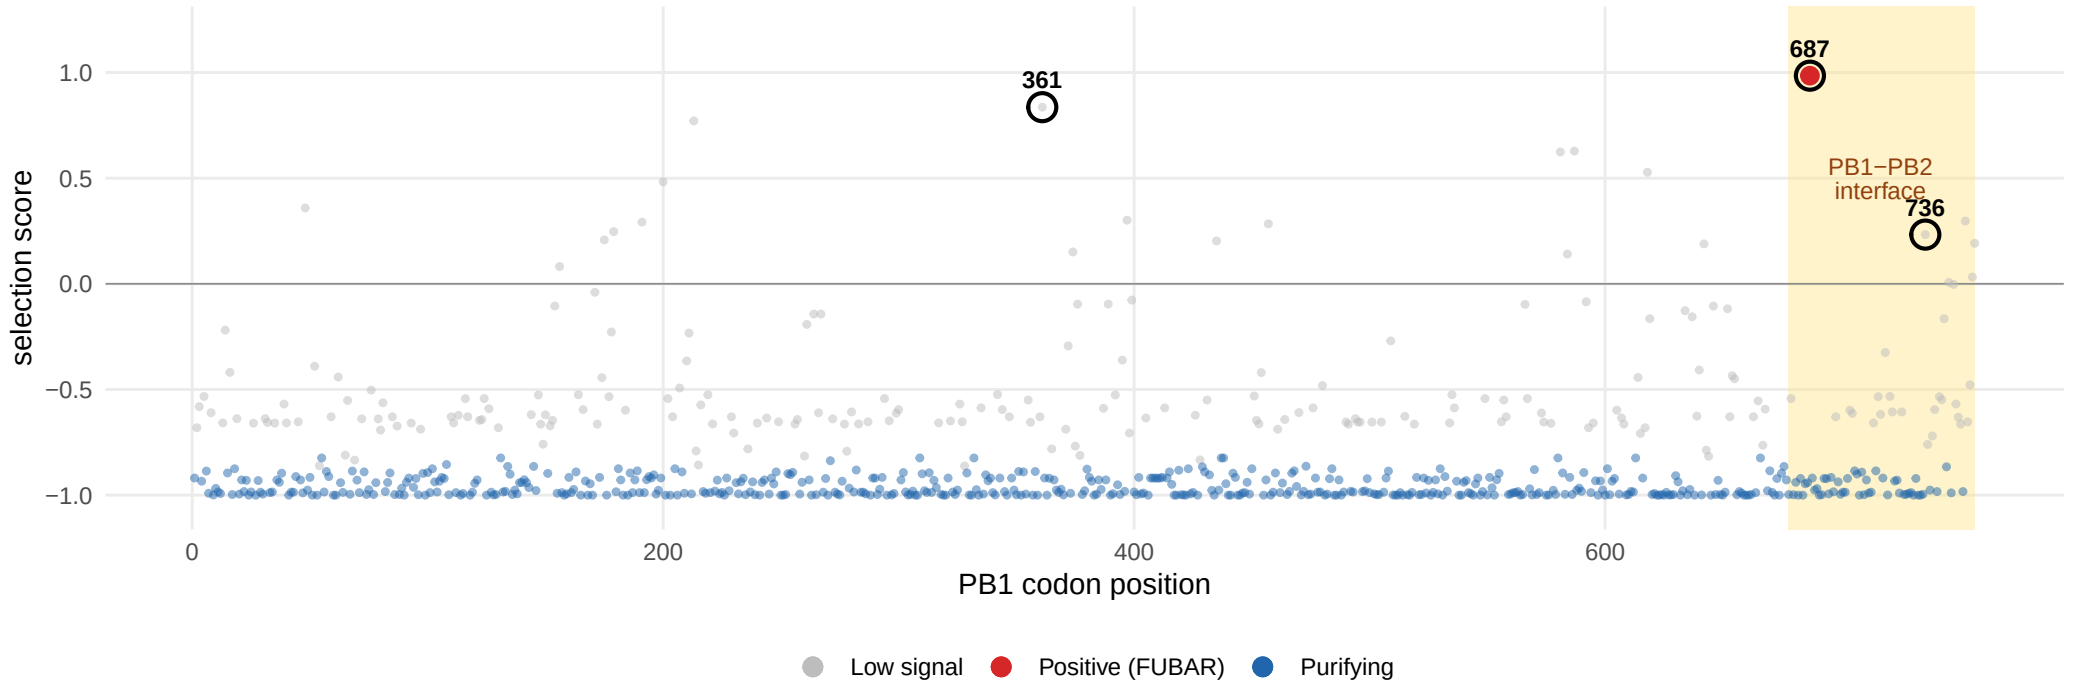
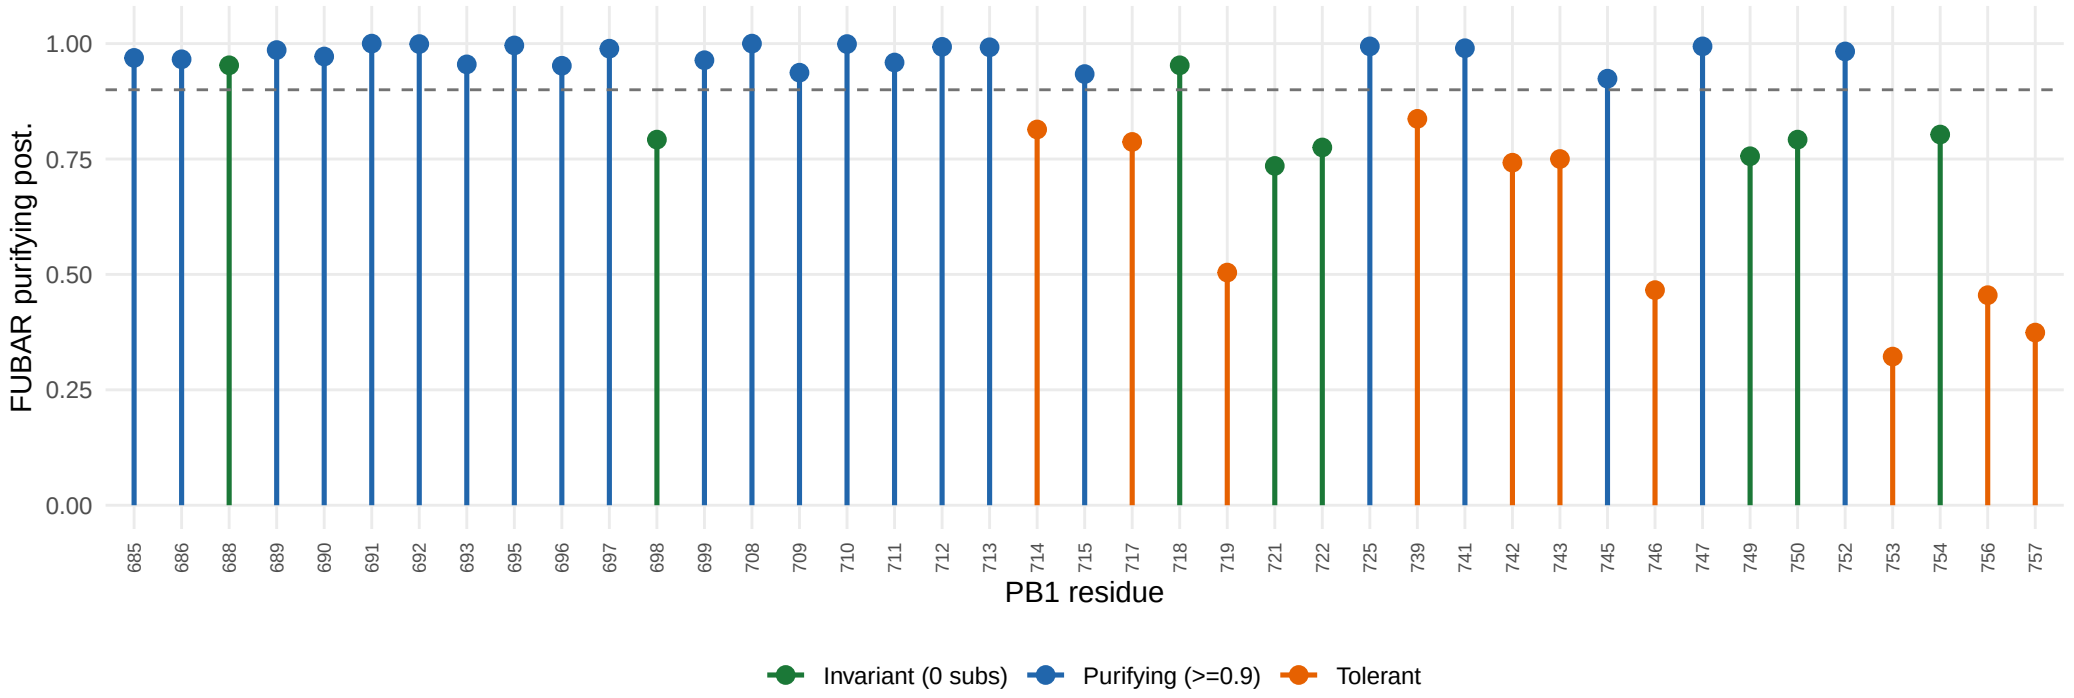
A) Selection across PB1 (each dot = 1 codon)

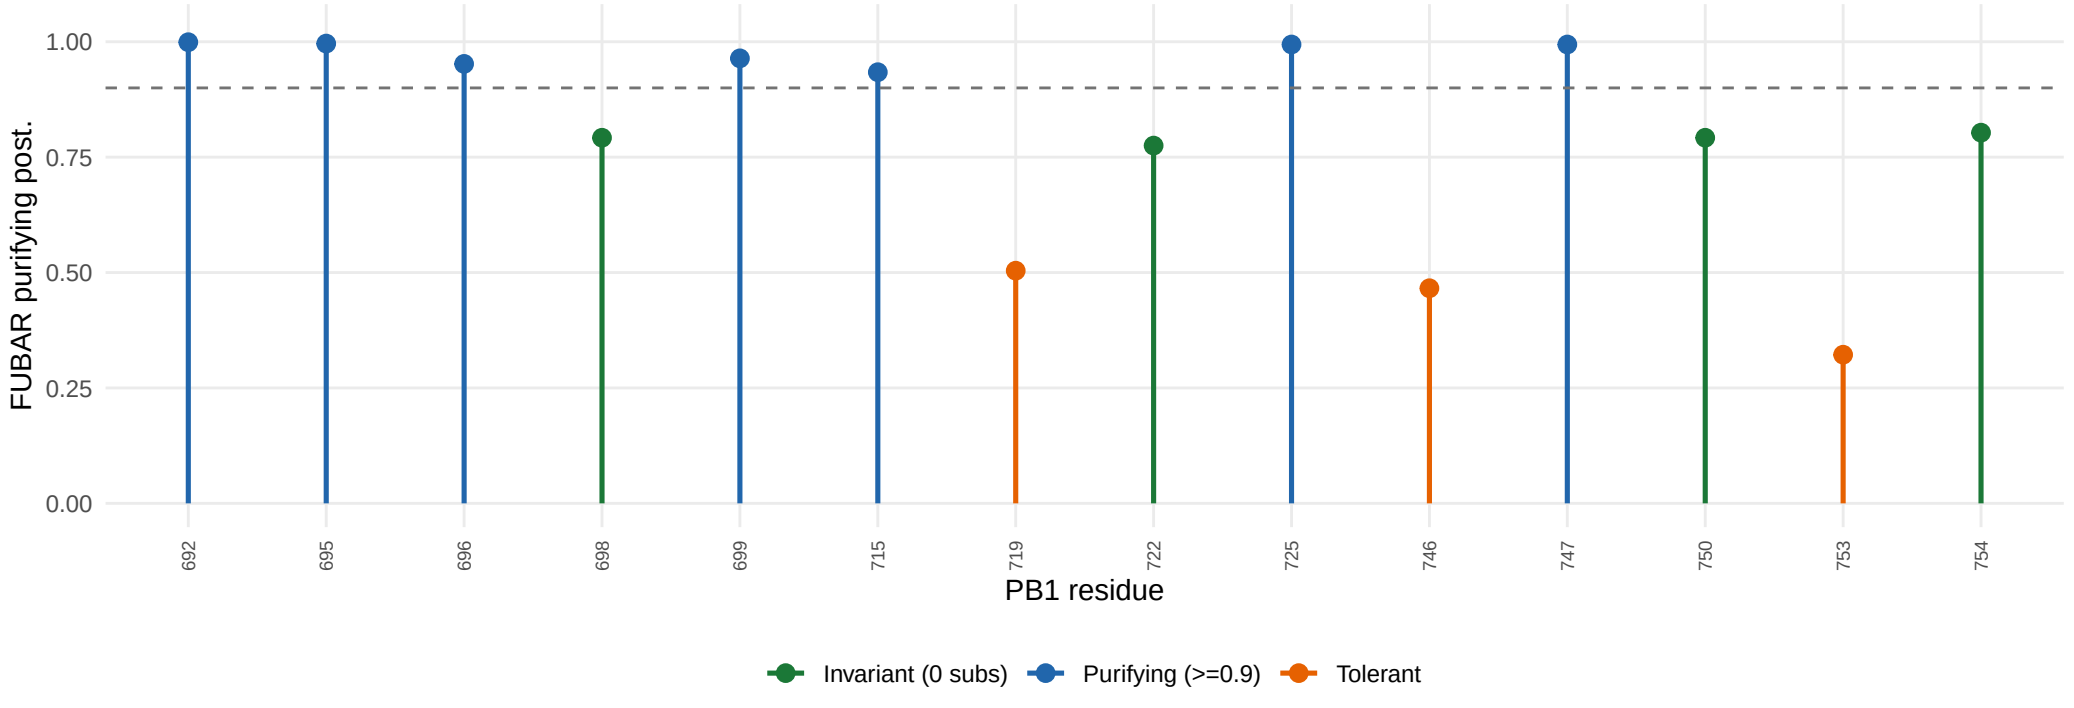
Lower = purifying, higher = positive. Red = pervasive positive (FUBAR); ring = MEME episodic. Ringed sites are not PB1−PB2 direct contacts.



B) PB1 4.5A interface set (41 residues)

Structural contact set (4.5 A, native PB2). None positive.



C) Sugiyama direct−contact pocket (14 residues)


Literature direct contacts (subset of B). None positive.
